

# Python for Beginners

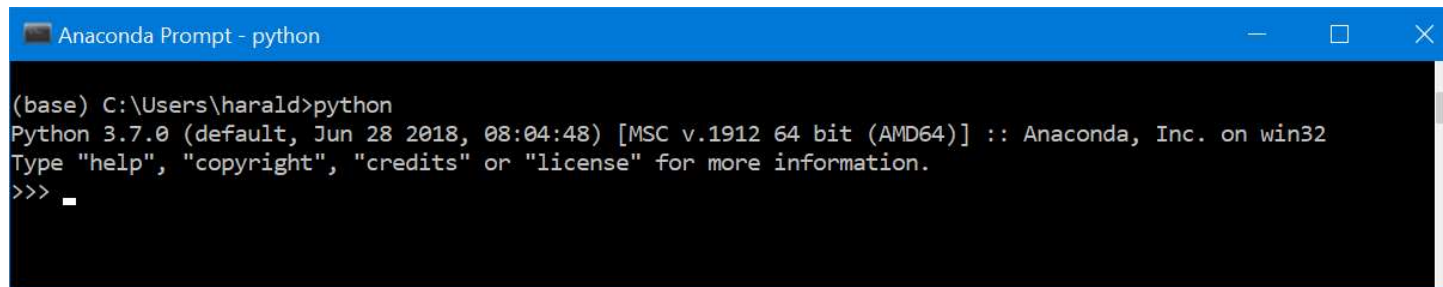

## 02 - Installation

# Python Distribution

- Do not install plain Python from <https://www.python.org>
- It is better to install a Conda Python Distribution to get
  - Integrated package and dependency management
  - Virtual environment management
- Anaconda:
  - Pro: Good for newbies.
  - Con: Needs more space on disk
- Miniconda:
  - Pro: Needs less space on disk (→ for Raspberry Pi)
  - Con: less convenient

# Python Installation (Windows)

- Download Anaconda 64bit for Python 3.6 from <https://www.anaconda.com/download/>
- Install Anaconda with default settings
- Don't install Visual Studio Code (we will use another IDE)
- Check the installation:
  - Start the **Anaconda Prompt**
  - And start the interactive Python Shell with “python”:

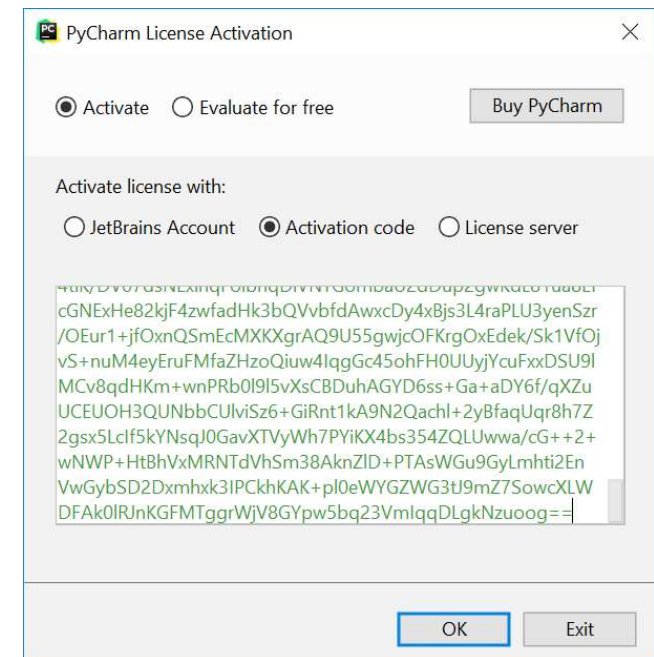

```
Anaconda Prompt - python
(base) C:\Users\harald>python
Python 3.7.0 (default, Jun 28 2018, 08:04:48) [MSC v.1912 64 bit (AMD64)] :: Anaconda, Inc. on win32
Type "help", "copyright", "credits" or "license" for more information.
>>> _
```

# PyCharm Installation (Windows)

- Download PyCharm Professional from <https://www.jetbrains.com/pycharm/>
- Run the PyCharm-\*.exe file you've downloaded
- Follow the instructions in the installation wizard

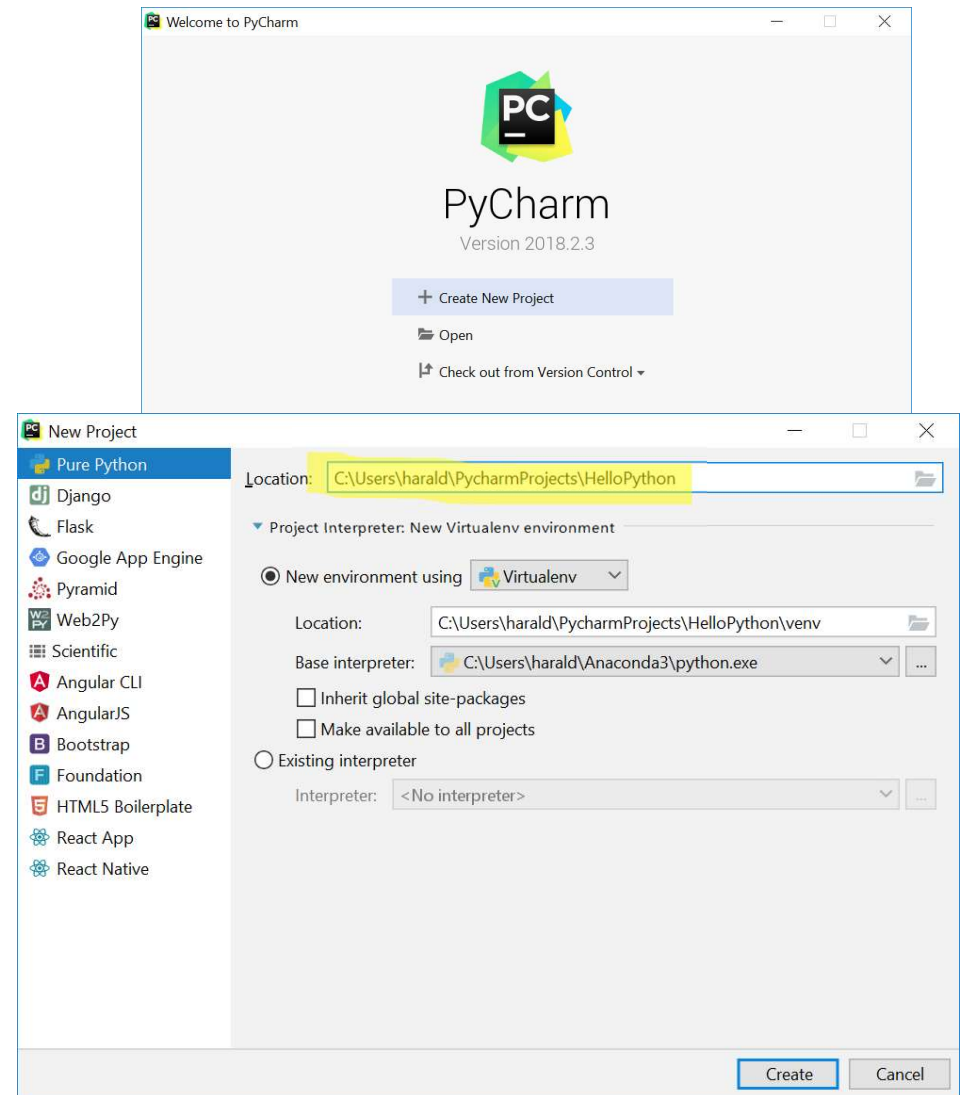

# PyCharm Registration / Activation

- Register with your school email address at <https://www.jetbrains.com/shop/eform/students>
- Run PyCharm for the first time
- Choose the "Do not import settings" option
- Enter the activation code you've downloaded at the registration
- If you don't have an activation code right now:
  - You can evaluate PyCharm for 30 days
  - You can use the license server (in our school network)

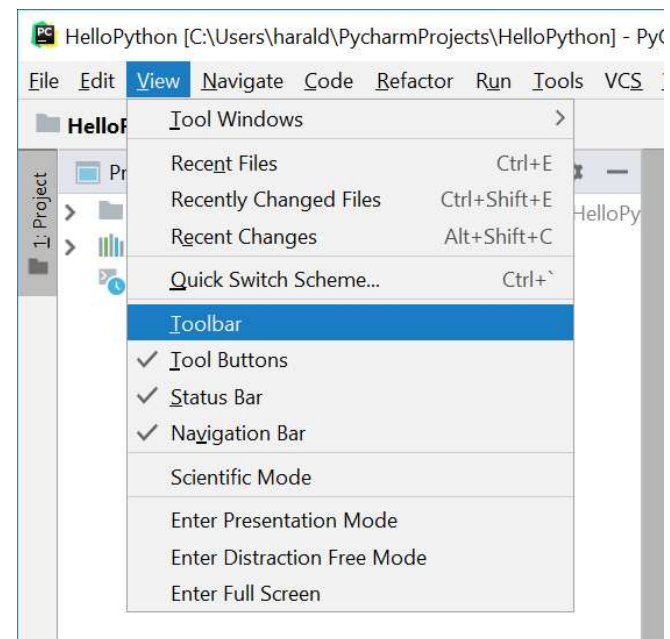

# Create a new Project

- Choose “+ Create New Project”
- Select “Pure Python”
- Set the location if the project
  - Should be a working directory for your python projects only
- Check the settings of the Project Interpreter / Virtual Environment
- And create the project

# PyCharm Settings

- Turn on the Toolbar and Tool Buttons ( if they are not turned on yet)

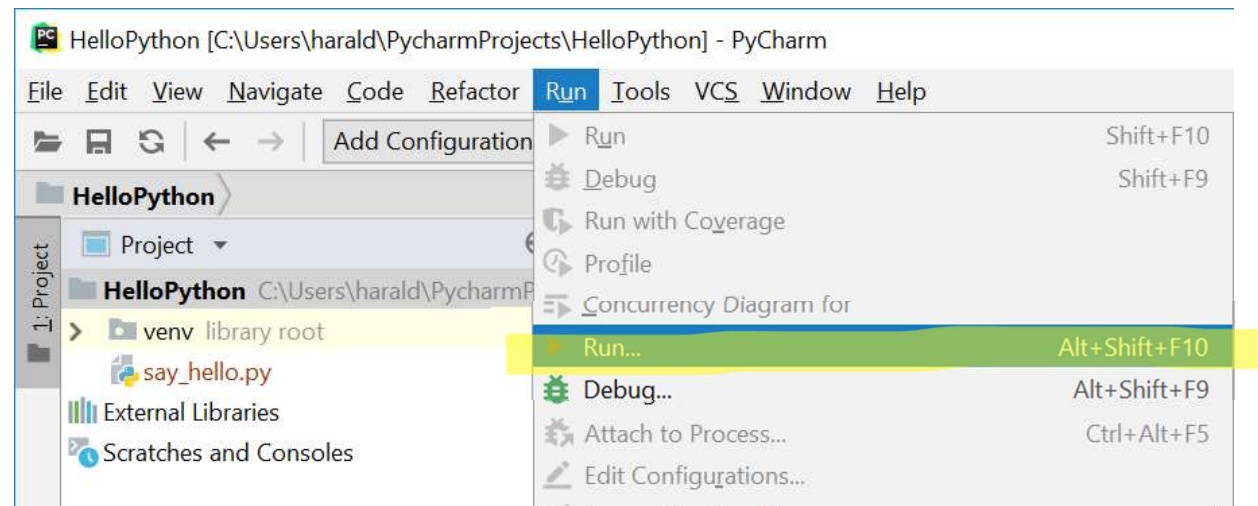

# Create a new python file

- Create a new python file “say\_hello.py”
- Enter the following code:

```
message = "Hello World"  
print(message)
```

- Create a new Run configuration via “Run” + “Run...”

# Create a Run Configuration

- Select “Edit Configurations”
- Click on “+” and select “Python”
- Enter the script path and click “Run”
